# THESAURUS ENTOMOLOGICUS OXONIENSIS;

OR,

ILLUSTRATIONS OF NEW, RARE, AND INTERESTING

INSECTS,

FOR THE MOST PART CONTAINED IN THE COLLECTIONS PRESENTED TO  
THE UNIVERSITY OF OXFORD  
BY THE REV. F. W. HOPE, M.A., D.C.L., F.R.S., &c.

WITH FORTY PLATES FROM DRAWINGS BY THE AUTHOR;

BY

J. O. WESTWOOD, M.A., F.L.S.,

late Professor of Zoology in the University of Oxford;

President of the Entomological Society of London; Knight of the Imperial Order of the Rose, Brazil; Honorary Member of the Royal Irish Academy, of the Entomological Societies of France, Holland, Berlin, Stettin, and St. Petersburg, of the Verein für Naturkunde of Munich, of the Natural History Society of Montreal, of the Literary and Historical Society of Quebec, of the Society of Natural History of Boston (U.S.), of the Natural History Society of Dublin, and of the Northern Entomological Society of England; Corresponding Member of the Soc. Royal des Sciences of Lille and of Liège, of the Société Philomatique of Paris, of the Soc. Royal d'Agriculture of Lyons, of the Royal Society of Arts and Sciences of Mauritius, and of the Natural History Society of Belfast; Member of the Physiographiska Sällskapet of Lund, of the Imperial Acad. Cesar. Leop. Carol. Natur. Curios. (cognomine Huetor), of the Naturforsch. Gesellsch. of Halle, of the Zool. Botan. Gesellsch. of Vienna, of the Ost Preuss. Physik.-Chem. Gesellsch. of Königsberg, of the Soc. Czar. Natur. Curios. of Moscow, and of many local Societies in England and Ireland.

---

"We should be apt to think too meanly of the attributes of our Creator, should we be able to come to an end of all His works, even in this sublunar world. And therefore I believe never any man yet did, never any man shall, so long as the world endures, by his utmost industry, attain to the knowledge of all the species of Nature."—JOHN RAY.

---

Oxford:

AT THE CLARENDON PRESS.

M.DCCC.LXXIV.

## SPECIES 5—LEIOPTERON APICALE.

*Nigrum, nitidum : capite rugoso, antice inermi ; antennis longis filiformibus, 14-articulatis ; thorace supra transverse rugoso, scutello basi biimpresso, apice bituberculato ; pedunculo thoracis longitudine fere aequali, sulcato ; pedibus nigris ; alis hyalinis, basi apieque anticarum fuscescentibus ; venis in medio alarum lutescentibus.* (Mas.)

Long. corp. lin. 5 ; expans. alar. antie. lin. 9.

Habitat ; Amazonia (Bates). In Mus. Hopeiano Oxonie.

## SPECIES 6—LEIOPTERON SUBPETIOLATUM.

*Nigrum, rugoso punctatum : capite antice piceo-rubo, spina parva inter antennas ; antennis fuscis 13-articulatis, articulis apicalibus compressis et sensim dilatatis ; scutello basi biimpresso, apice inermi ; pedunculo abbreviato supra sulcato ; abdomine ovali compresso, terebra longe pone apicem abdominis exserta fig. 12 c) ; alis flavido hyalinis, fascia indistincta media guttaque minuta obscuriori ultra cellulam posita ; pedibus nigro-piceis.*

Long. corp. lin. 3½ ; expans. alar. antie. lin. 6.

Habitat ; Amazonia (Bates). In Mus. Hopeiano Oxonie.

## SPECIES 7—LEIOPTERON CLAVICORNE.

*Nigrum, rugosum punctatum : capite inter oculos spina parva armato, facie, antennisque piecis, his 13-articulatis apicem versus compresso-clavatis, articulis 5 apicalibus præstertim majoribus ; scutello biimpresso, apice integro ; pedunculo subbrevi sulcato ; abdomite magno ovali compresso apice acuminato ; alis hyalinis, nubila transversa ante medium alarum obscuriori venas crassiores includente.* (Form.)

Long. corp. cum oviduct. exsert. lin. 3½ ; expans. alar. antie. lin. 5.

Habitat ; Amazonia (Bates). In Mus. Hopeiano Oxonie.

## SPECIES 8—LEIOPTERON UNIFASCIATUM.

*Nigrum, rugosum : capite inter antennas tuberculo parvo conico instructo ; mesonoto transverse rugoso, scutello areolato, biimpresso, apice obtuse bituberculato, pedunculo fere thoracis longitudine, sulcato ; antennis corpore paullo longioribus, 14-articulatis, apicem versus paullo crassioribus (fig. 12 c) ; alis hyalinis, antieis pone medium fascia lata fusa, antice obscuriori, tegulis pedibusque rufis, posticis obscurioribus.*

Long. corp. lin. 2 ; expans. alar. antie. lin. 4½.

Habitat ; Amazonia (Bates). In Mus. Hopeiano Oxonie.

## FAMILY—CHALCIDIDÆ.

## GENUS—LEUCOSPIS.

## SUB-GENUS—POLISTOMORPHIA.

(Westw. in Germar's Zeitschr. f. d. Entomologie, vol. i. p. 265.)

Sub-genus intermedium inter *Leucospides* et *Chalcides* : abdominis articulo basali pedunculum crassum formante, oviductu interno, haud supra dorsum extensum ; pedibus posticis minus incrassatis ; facie versus os attenuata.

## SPECIES 1—POLISTOMORPHA SURINAMENSIS.

(Westw. in Germar's Zeitschr. f. d. Entomologie, vol. i. p. 265, pl. IV, fig. 5.)

## PLATE XXV, FIG. 2.

*Fulva, obscurens : thorace lineis nonnullis fuscis ; alis fulvescentibus ; abdomine elongato ; femoribus posticis 10-12-denticulatis.*

Long. corp. lin. 7½ ; expans. alar. antie. lin. 14.

Habitat ; Surinam, in Mus. Reg. Berol., et Amazonia (Bates), in Mus. Hopeiano Oxonie.

Fulva, cibre punctata haud nitida; caput sere thoracis latitudine, facie versus os attenuata, oculis lateralibus, mandibulis bidentatis, antennis fulvis; thorax elongatus, ovatus, antice et postice truncatus; prothorace in collum parvum at distinctum format; collare transverso, fascia tenui centrali fusca; mesothoracis scuto transverso, macula parva triangulari centrali (antice latiori) lineaque duabus oblique lateralibus fascia, parapleuris distinctis; scutello triangulari postice rotundato, macula majori centrali fusca; metathorace elongato subquadrato, spiraculis lateralibus distinctis, linea tenui fuscoescenti; abdomen elongatum sexannulatum segmentis tribus primis brevibus secundo breviori, quarto maximo ovato, latiori; duobus ultimis ministris, spiraculis lateralibus distinctis, fulvum segmento primo interdum macula parva triangulari fusca lineaque tenui dorsali levavi; oviductu haud exerto; pedes fulvi elongati, femoribus posticis minus incrassatis quam in Leucospidibus, subtus 10-12-denticulatis, dente primo maximo dentibusque 5, 6, et 7 reliquis majoribus; coxis posticis extus dente armatis; ale flavescentes, venis distinctis stigmatoque fascia, venis subobsoletis fulvescentibus.

#### SPECIES 2—POLISTOMORPHA FASCIATA.

##### PLATE XXV, FIG. 2.

Fulva, minute punctata: capite et thorace nigro maculatis; abdomine fulvo fasciis flavis; aliis flavescentibus; femoribus posticis 7-dentatis.

Long. corp. lin. 6; expans. alar. antec. lin. 12½.

Habitat: Amazonia (Bates). In Mus. Hopeiano Oxonie.

Caput fulvum, margine postico, verticale inter ocellos et ocellos nigri; thorace nigro variegato, collare macula media trigona; mesonoto, maculis tribus elongatis, intermedia obscurior; scutelli basi et metanoti dorso bivittatis, lateribus spina media armata; abdomine fulvo-rufescente, setoso, flavo-fasciato; antennae pedibusque fulvia, femoribus posticis supra vitta flavescente, spina 1 media angua fulva, alteriusque 6 minoribus apicalibus nigris; aliis fulvo-hyalinis, apicem versus griseocanibus, venis stigmatoque fascia.

#### SPECIES 3—POLISTOMORPHA SPHEGOIDER.

(Walker, Journal of Entomology, vol. i. p. 22.)

##### PLATE XXV, FIG. 1.

Form. Piceo-nigra punctata: antennae rufa, basi nigris; prothorace linea postica transversa brevi pallide fulva; mesothorace linea duabus pallide fulvis postice approximatis; tegulis punctisque duabus scutelli fulvis; metanoto supra longitudinaliter carinato; abdomen cinereo-pubescenti, segmento primo basi et apice fulvo fasciato; pedibus tibialis tarsisque anterioribus fulvis; femoribus posticis fulvo pallidissimo vittatis 6-dentatis; aliis luridis.

Long. corp. lin. 9; expans. alar. antec. lin. 18½.

Habitat: Brazil, St. Paul (Bates). In Mus. Britan. et Oxonie.

Very thickly and minutely punctured; head in front and mouth much prolonged; epimera partly pale tawny; metathorax with a dorsal ridge and an elevated border; abdomen keeled above and beneath; first segment linear, with a tawny hind border, much narrower than the other part, which is elongate pyriform; hind femora armed with six rather large teeth.

#### GENUS—LEUCOSPIS.

#### SPECIES 1—LEUCOSPIS DARLINGII.

##### PLATE XXV, FIG. 4.

Nigra, punctata, aurantio-rubo variegata: aliis fasciis purpureo nitidis, articulo basali antennarum fulvo; femoribus posticis obscuris; capite viridi parum tincto; collare fulvo, lateribus, margine antico, lineaque media tenui abbreviata nigra; mesonoto nigro, lateribus anguste, maculisque duabus dorsalibus ovalibus fulvis; tegulis fulvo marginatis; scutello fulvo angulis anticus lateralibus nigris; metanoto nigro; abdominis segmento pedunculari fulvo-rubo, margine tenui nigro; secundo nigro, tertio fulvo, quarto nigro, quinto fulvo; oviductu

recurvo, ad medium scutelli extenso; pedibus fulvis; tibiis 4 anticus extus obscurioribus; coxis posticis in medio supra spina armatis, femoribus piecis supra magis fulvis, spina 1 majori, 8 minoribus armatis; alarum venis fuscis.

Long. corp. lin. 7½; expans. alar. antie. lin. 13½.

Habitat; Darling Downs, Australia. In Mus. Hopeiano Oxonie.

SPECIES 2—LEUCOSPIS CUPREO-VIRIDIS.

PLATE XXV, FIG. 5.

*Aeneo-viridis*, punctata cupreo-variegata: antennis pedibusque testaceis; alis fusco-flavescitibus, venis fuscis; collare transverso rufo, in medio transverse obscuriori; mesonoto obscure aeneo lateribus marginis que postico rufis, scutello et postscutello viridibus; metanoto cupreo-rufo aeneo tinctorio; abdomine aeneo-viridis, griseo setoso; oviductu rufo, ad basin segmenti tertii tantum attingente; pedibus testaceis, coxis posticis extus obtuse angulatis; femoribus subtus spina 1 magna, 8 minoribus armatis. (Fem.).

Long. corp. lin. 3½; expans. alar. antie. lin. 6.

Habitat; Sta. Martha, New Granada. In Mus. Hopeiano Oxonie.

SPECIES 3—LEUCOSPIS REGALIS.

PLATE XXV, FIG. 6.

Rugosa-punctata: capite annulo; antennis nigra, articulo ultimo rufescit; thorace supra purpureo, viridi paullo tineto; abdomine concolori, segmentis ad apicem paullo constrictis; oviductu rufo, usque ad postscutellum recurvo; pedibus purpureis viridi tinetis; coxis posticis extus ad spicem angulatis; femoribus posticis subtus tuberculo in loco spinae magnae, spinaque 8 parvis (intermediis majoribus) armatis; alis brunneo-fuscis venis obscurioribus.

Long. corp. lin. 7; expans. alar. antie. lin. 11.

Habitat; Philippine Island Lason, Camiguin (D. Semper). In Mus. D. Semper, Altonæ.

SPECIES 4—LEUCOSPIS ANTHIDIOIDES.

PLATE XXV, FIG. 7.

Brevis crassa, nigra, opaca, punctata, luteo-setosa: collaris margine antico tenui, postico late flavis; mesonoto lateribus, tegulis et scutelli margine postico fulvis; abdominis segmentis 1 et 2 postice setis luteis marginatis, quarto et reliquis fulvis, segmento primo pedunculari late campanulato; antennis piecis, articulo basali subtus flavo in medio nigro; pedibus brunneis, coxis posticis flavo marginatis; femoribusque intus striola flava notatis. his subtus spina 1 magna alterisque 7 minoribus armatis: oviductus squama basilari fulvo, utrinque nigra guttato; oviductu, vix ad postscutellum retro extenso; alis flavidis venis brunneis.

Long. corp. lin. 4; expans. alar. antie. lin. 9½.

Habitat; Amazonia (Bates). In Mus. Hopeiano Oxonie.

GENUS—METAMORPHA.

(Walker, Trans. Ent. Soc. 3rd Ser. vol. i. p. 347.)

Form. Corpus leue, nitens: caput transversum subquadratum, collo distineto, fronte verticali; palpi gracillimi, ... (mutilated in the specimen described); prothorax subquadratus bene determinatus; humerus rotundatus; mesothorax elongatus, parapsidum suturis distinctissimis; scutello conico, parapteris magnis; metathorax scaber, bene determinatus; petiolus brevissimus; abdomen compressum valde gibbosum, thorace brevius; oviductus recurvus longissimus; pedes sat graciles; ale longæ angustæ; tibiæ calcaribus brevibus apicalibus; coxis posticis longis.

'With the humerus emitting into the disc, at a little beyond half its length, a branch from whence the two spurious veins proceed; ulna rather less than one-third of the length of the humerus; radius extending nearly to the tip of the wings, more than twice the length of the ulna; cubitus very short, furcate.'

Mr. Walker considers that 'this genus belongs to the Torymidae, and is most nearly allied to *Megastigmus*, but it has also a tendency to the structure of the Leucospidae, and shows the transition between these two families'—a position I am not inclined to adopt, failing to observe any relationship with *Leucospis*.

The mandibles are strong and armed with three teeth, as in pl. XXV, fig. 10 a, the inner part representing the fourth tooth being broader and obtuse.

The British Museum specimen has the terminal joints of the antennae broken off, the second joint of the antennae very small, and the third minute and annular, the fourth and following much longer than the second, and setose.

I regret that the rule of priority compels me to adopt the absurd names, both generic and specific, given to this insect by Mr. Walker.

#### SPECIES 1—*METAMORPHIA LEUCOSPOIDES*.

(Walker, Op. cit. supra, p. 346.)

#### PLATE XXV, FIG. 8.

'Form. Nigra: caput antice flavum, nigro-vittatum, oculis flavo-submarginatis; prothorax flavo-quadrinotatus; parapsides paraptera et scutellum flavo-marginata; abdomen basi subtusque flavum; segmentis flavo-marginatis; pedes lutei, coxis flavis nigro-varia, femoribus posticis nigris apice luteis; tibias tenuique posticis flavis; alae lurido-cineraceæ, venis nigris.'

Length of the body, 5–6 lines; oviduct, 10 lines; expansion of the fore wings, 10 lines.

Habitat: Bootan (Pemberton), in Mus. Britann.; Assam, in Mus. Hopeino Oxenai (slim nests).

I found a specimen of this interesting species lying dead and loose in a box of insects received from Assam, sent me by Major Jenkins. I had no means of determining whether it had been developed from any of the insects, or had accidentally entered the box, or had fed upon some insect which might have attacked the wood or cork of the box.

#### GENUS—*EUDOXINNA*.

(Walker, Trans. Ent. Soc. 3rd Ser. vol. ii. p. 206.)

Form. Corpus sit robustum; caput et thorax punctata subpubescens, caput levissimum, verticale thoracis latitudine; facies subdepressa, striata, striis versus et convergentibus (fig. 9 a); mandibulae filante intus dente unico armata; palpi breves; antennæ 9-articulatae, filiformes, fronte insertæ; articulus primus sublevatus, subcompressus tuberculo parvo globoso subprope apicem instructus, secundus levissimus, tertius et sequentes lineares subsequales pubescentes parum attenuati, nonus apice conicus; prothorax transversus, lateribus rotundatus; mesothorax brevis; parapsidum sutura conspicua; pampyga et opimera magna; scutellum vix bidentatum; metathorax bene determinatus, fore verticalis; abdomen hinc valde compressum (fig. 9 b), thorace non longius; segmenta antice contracta; pedes lutes simplices levissimæ; femora elevata; tibiae compressæ, omnes pressione intermedio extremitate media dilatata; aliæ sectiones hinc non longæ.

SYN.: *Scastra*. Walker, slim, Trans. Ent. Soc. Lond. 3rd Ser. vol. i. p. 370.

'Humerus extending at some distance from the costa; wings about one-fifth of the length of the humerus; radius about twice the length of the wings; cubitus somewhat shorter than the wings.'

Mr. Walker states that this 'very remarkable genus partakes of the characters of the Chalcidites and of the Cynipites, and seems to differ from them both as much as they do from each other. It agrees with the Chalcidites in the structure of the wing veins, and may be considered as the type of a new family of that tribe.'

Except in having the abdomen compressed and the scutellum slightly bidentate (characters found in many other Chalcididae), I can perceive no relationship with the Cynipidae. The genus appears nearest related to the Eurytomidae.

## SPECIES 1—EUDOXINNA TRANSVERSA.

(Walker, Op. cit. supra, p. 371.)

## PLATE XXV, FIG. 9.

‘Form. Flavescente fulva : caput nigrum lituris antice flavis ; prothorax lineis duas transversis nigris, prima interrupta, secunda abbreviata ; scuto linea nigra ; tibie posteriores ex parte nigricantes ; alæ cinereæ, venis fulvis lurido-marginatis.’ (Walker, l. c.)

Long. corp. lin. 4 ; expans. alar. antic. lin. 7.

Habitat ; Amazonia, Ega (Bates). In Mus. Britann.

## GENUS—CHETOSPILA.

Caput quadratum antice trilobatum ; mandibulæ subtrigone apice obliquo 4-dentato (pl. XXV, fig. 10 a) ; maxillæ lobo apicali membranaceo rotundato setoso, palpis maxillaribus 4-articulatis articulis primo et tertio brevibus (fig. 10 b) ; mentum oblongo-ovale ; labium oblongum in medio paullo constrictum apice rotundato, palpis labialibus biarticulatis articulis æqualibus (fig. 10 c) ; antennæ 8-articulatæ (absque articulis annuliformibus) articulis 2-7 longitudine fere æqualibus at sensim crassioribus, ultimo majori longo-ovali (fig. 10 d) ; collare semi-ovale capite angustius ; mesonotum scutum breve, scutellum magnum ; pedunculus abdominalis brevis ; abdomen magnum ovale ; alæ amplæ, setis longis marginatæ, vena subcostali trientem costæ vix attingente, apice ejus in fasciculum setarum erectarum terminato, ramo stigmaticalí minuto ; pedes graciles.

The remarkable fascicles of short erect bristles at the junction of the subcostal vein with the costa is quite peculiar, and, so far as I have observed, does not occur in any other insect. The insect is closely allied to Cerocephala, from which it differs in the short peduncle to the abdomen and the 8-jointed antennæ, these organs in Cerocephala being distinctly 10-jointed, the eighth and ninth being equal in size to the two preceding joints.

## CHETOSPILA ELEGANS.

## PLATE XXV, FIG. 10.

Æneo-viridis, nitida, levigata : capite et collare fulvis, pone oculos et ad latera æneo-tinctis ; dorso thoracis æneo ; metanoto cum pedunculo brevi fulvo ; abdomine æneo ; antennæ piceæ, articulo basali fulvo ; pedibus fulvis ; alis hyalinis apicibus iridescentibus, fasciculo setarum nigrarum, nubila substigmatali fulvescenti.

Long. corp. lin. 1 ; expans. alar. lin. 1 ½.

Habitat parasitice in Zeæ Maydis seminibus (D. Raddon). In Mus. Hopeiano Oxoniæ (olim nostr.)

## GENUS—THEOCOLAX.

(Westw. Lond. and Edinb. Phil. Mag. 3rd Ser. vol. i. No. 11, p. 127 ; Mod. Class. Ins. Gen. Syn. p. 66 ; *Læstria*, Haliday (Curtis MS.), Ent. Mag. vol. i. p. 268 ; ib. p. 335 ; *Cerocephala pars*, Walker, Ent. Mag. vol. ii. p. 149.)

Corpus oblongum, in utroque sexu subapterum : alæ valde rudimentales scutello haud longiores ; caput oblongo-quadratum, margine ovali utrinque et fronte antice mucronatis ; oculi minuti glabri ; antennæ infra medianam faciem insertæ remotæ, summa 9-articulatae clavatae articulo ultimo magno ovali exarticulata (fig. 11 e), maris 10-articulatae ante apicem incrassatae (fig. 11 d) ; collare antice attenuatum ; abdomen subcæruleum ovatum haud depresso, aculeo feminae exerto brevi subconico ; mandibulae parvae subquadrate apice truncato 4-dentato (fig. 11 a) ; maxillæ lobo magno plano membranaceo ovali ciliato instructæ, palpis maxillaribus 4-articulatis, extus setis nonnullis longis, articulis primo et tertio minutis (fig. 11 b) ; labium elongatum apice subrotundato, palpis labialibus 2-articulatis (fig. 11 c) ; thorax oblongus capite longior et angustior ; collare crateriforme, antice attenuatum ; mesothorax quadratus, scuto transverso, humeris minutissimis ; scutello transverso subquadrate ; parapteris minutissimis valde remotis ; pedes mediocres.

This genus is most nearly allied to Cerocephala and Chetospila. It is also related to Spalangia.

## THEOCOLAX FORMICIFORMIS. (Fam.) Westw.

(Mod. Class. Gen. Synops. p. 66; *Lecithis neptunia*, Haliday, Ent. Mag. vol. i. p. 336.)

## PLATE XXV, FIG. 11.

*Testacea glabra, vertice thorace et abdomen luteo supra secco-nitidis; pedibus pallidioribus; abdome et antennis apice obscurioribus.*

Long. corp. lin. 1.

Habitat; in domibus, tarde ambulans, *Anobii* parasita. In Mus. Hopeiano Oxonie (olim nostr.)

I have reared a considerable number of specimens of both sexes of this interesting little insect from pieces of deal timber flooring infested with the larvae of *Anobius striatus*. In June and July, 1834, I also took several specimens crawling about papers upon an old table much worm-eaten.

## GENUS—CEROCEPHALA.

(Westw. in Guérin, Mag. de Zool. 1<sup>re</sup> Livraison. pl. IV (1832); Walker, Ent. Mag. vol. ii. p. 148 (pars); *Epimeurus*, Ibid. vol. i. p. 369.)

This genus is closely allied to *Theocolax*, having, like it, a tridentate head and large triangular collar; but it is fully winged, and the antennæ of the males are 10-jointed (pl. XXV, fig. 12). The type *C. corniger*, Westw. (Op. cit. and Stephen's Illustr. Brit. Ent. Man. pl. XLV, fig. 1; *Epimeurus rufus*, Walker, Ent. Mag. i. p. 149), was taken by Mr. R. Lewis on trunks of trees in St. James's Park, London, in the Spring of 1832. I also took it on palings on Wandsworth Common in July, 1835. Mr. Stephens took it near Ripley, and Mr. Doubleday near Epping.

The males vary in their size as well as in the amount of development of the frontal horns.

## SUB-FAMILY—PERILAMPIDÆ.

## GENUS—PHILOMIDES.

(Haliday, Annales Soc. Ent. France, 4th Ser. Tom. ii. (1862), p. 115; *Eucopetes*, Westw. MS. offim.)

'Tarsorum unguiculi subtus dilatati, arolium inconspicuum: caput antice profunde excavatum pro receptione antennarum; epistoma transversum; genæ breves subintegrae; prothorax immarginatus; scuti mesothoraci parapides subparallelæ; scutelli parapides conniventes; alarum anticarum venæ normalis segmentum costale, citra ramum radiale; hoc parum longius; abdomen segmento primo brevissimo annulari.'

The head (fig. 1 a) has a deep oval impression between the eyes in which the antennæ are received when at rest, the large club falling upon the basal scape (pl. XXVI, fig. 1 b). The mandibles are acute and sickle-shaped, with a tooth on the inner margin towards the middle. The maxillæ are terminated by an elongated lobe armed with strong bristles on its outer edge (fig. 1 c); the maxillary palpi are very short and apparently 4-jointed, the basal joint very short, the second the largest, angulated in the middle of the inner margin and bristly; the two terminal joints minute. The labium is ovate, with two short 2-jointed palpi, strongly setose (fig. 1 d). The tarsal unguis are denticulated on their inner edge (fig. 1 e).

The specimen of this species now in the Museum of the Jardin des Plantes, Paris (Coll. Siebel), has the club of the antennæ more slender, and the yellow lateral spots of the scutellum are united by a pale band across its base.

## PHILOMIDES PAPHIUS.

(Haliday, l. c.; *Eucopetes excavata*, Westw. MS.)

## PLATE XXVI, FIG. 1.

Flavus: occipite, metathorace, pectore mesothoracis macula oblonga antica, fascia media utrinque antrorum lobata et scutelli apice nigra; antennarum flagello aliquæ ferruginosæ. (Mas.)

Long. corp. 3–4 lin.; expans. alar. antie. 6½–7 lin.

Habitat; Ile de Chypre (Coll. Mus. Paris, olim Siebel) etiam in Albania. In Mus. S. S. Saunders.

## GENUS—EURYTOMA.

## EURYTOMA MELLEA. Westw.

## PLATE XXVI, FIG. 2.

*Luteo-fulva*: capite et thorace punctatis, abdomine compresso ovato glabro; capite sulco profundo frontali, margine postico macula trigona fusca; antennis fuscis articulo secundo fulvo annulo nigro basali; collari late fulvo; mesonoto in medio et lateribus fuscis; scutello magno fulvo; abdomine fulvo, segmentis margine postico lato fuscis; pedibus fulvis, femoribus subtus ad basin fuscis; alis melleis, nubila obliqua mediana obscuriori.

Long. corp. lin. 4½; expans. alar. antic. lin. 6.

Habitat; Brazil, Para (Burchell, No. 1409, Sept. 9, 1829, ‘plura individua e fructu quodam educata,’)—(an parasitice?)

Obs.—The *Chalcis pomorum* of Fabricius!, Syst. Piez. 163, with simple hind legs, parasitic on fruit-feeding larvae, is evidently congeneric with the insect here described.

## GENUS—EUCHRYSSIA.

Caput antice utrinque excavatum carina media conica; antennæ graciles 11-articulatæ, articulo primo longo, secundo mediocri, tertio minimo annuliformi; octo ultimis longitudine æqualibus, ultimo ad apicem attenuato; alæ antice vena radiali clavata, longe a subcostali remota; pedes intermedii calcari mediocri; tarsis basi haud incrassatis; pedes posticii femoribus incrassatis subtus inermibus aut tuberculo medio conico tantum instructis; tibiis arcuatis extus setigeris, calcaribus duobus armatis.

Locus; Australasia.

## SPECIES 1—EUCHRYSSIA CLEPTIDEA.

## PLATE XXVI, FIG. 3.

Capite et thorace rubris punctatis; mesonoto in medio maculis duabus triangularibus cœruleis; metanoto postice cœruleo tincto; abdomine chalybæo, nitido, basi apiceque viridi nitidis; antennis longis, gracilibus, nigris articulis duobus bassilibus pedibusque quatuor anticis rufis; pedibus duobus posticis cum coxis cœruleis; tibiis extus setosis, basi basique articuli primi tarsorum albidis, horum reliquis articulis fuscis; alis hyalinis, fascia longitudinali lunari ramulum emittente ad angulum posticum alarum extensem fusca, femoribus posticis incrassatis, subtus sulcatis anguloque obtuso prominente inter medium et apicem instructis. (Fem.)

Long. corp. lin. 2½; expans. alar. antic. lin. 4½.

Habitat; Adelaide, Australasia (D. Fortnum). In Mus. Hopeiano Oxoniæ.

## SPECIES 2—EUCHRYSSIA GEMMEA.

## PLATE XXVI, FIG. 4.

Lutea cœrulea, minute punctata, viridi parum tincta: antennis longis gracilibus 11-articulatis, articulo primo longo, secundo mediocri, tertio annuliformi, quarto et reliquis longitudine fere æqualibus (fig. 4a); abdome glaberrimo, rufo cupreo, apice acuminato; alis fulvo hyalinis, nubila discoidali paullo obscuriori; femoribus posticis subincrassatis; tarsis fuscis, articulo basali pallidiori. (Fem.)

Long. corp. lin. 3; expans. alar. antic. lin. 5.

Habitat; Adelaide, Australasia (D. Fortnum). In Mus. Hopeiano Oxoniæ.

The labrum (fig. 4a) is transverse and setose, the mandibles small and broad, with one apical acute and two obtuse teeth (fig. 4b); the maxillæ are terminated by a large membranous ciliated lobe, with the maxillary

①C. obscura, abdomine compresso basi gibbo, alis macula fusca; habitat in America meridionali in larvis poma infestantibus; Dom. Smidt; Mus. Dom. Lund. Magna, antennæ nigrae articulo primo subtus testaceo; thorax fuscus antice lineolis duabus parvis testaceis; abdomen elongatum basi compressum, gibbum apice conicum, acutum; alæ albide, macula magna medio fusca; pedes simplices pallidi femoribus nigris.

palpi (fig. 4 c) 4-jointed, and scarcely longer than the lobe; the mesatum is subcordate, the labium obtusely pointed at the tip, and the labial palpi small and 3-jointed, the middle joint the shortest (fig. 4 d). The hind femora are moderately incrassated, without any spine on the under margin; the hind coxae are produced into a small spine near the tip of the outer margin. The antennae are inserted just above the mouth widely apart, the basal joint received, when at rest, in an oblique channel of the face between the eyes.

#### SCONUS 3—EUCHRYSSIA PRASINA.

Capite et thorace viridibus, punctatisimis; scutello concolori punctis majoribus rotundatis crebrissime impresso; metathorace et abdomen nitidis viridibus caeruleoque tinctis; pedibus viridibus; tarsis nigris, intermediis articulo basali parum crassiori subalbido, femoribus posticis subclavatis, apicem versus subtus submarginalis; alis hyalinis, venis nigricantibus.

Long. corp. lin. 3; expans. alar. antec. lin. 4.

Habitat; in partibus Septentrionalibus Novae Hollandiae. In Mus. Hopeiano Oxonie.

#### GENUS—CHRYSEIDA.

(Spinæ in Guérin, Magasin de Zoologie, 1840, Ins. pl. XLII.)

##### SCONUS 1—CHRYSEIDA SUPERCILIOSA. Spinæ.

The type of this Genus, from Cayenne, is described as a male, and is remarkable for the great development of the prosternum, which is concave on its upper side, ‘formant une cuvette de cuiller au fond de laquelle, la tête se retire en partie quand elle se repose, et où elle peut enfouir toutes les parties de la bouche.’

The antennæ are 11-jointed; the second joint is, however, very minute, the five following cylindrical and elongated, and the four terminal ones much shorter, forming an elongated mass.

##### SCONUS 2—CHRYSEIDA AMAZONICA.

##### PLATE XXVI, FIG. 5.

Capite obscurè cupido, punctato; fronte in tuberculis duo perfecta truncata, inter oculos, producta (fig. 5 a); thorace rude punctato viridi; abdomen nitido chalybeo, viridi pennis tincto; antennis nigris, articulo basali fulvo; pedibus 4 antice nigris, geniculis apicibus tibiarum luteis; tibiis 2 posticis brunneis; tarsis omnibus luteis apice nigricantibus; alis pallide flavescensibus, nubila pallida mediana magis flavescens.

Long. corp. lin. 3; expans. alar. antec. lin. 5.

Habitat; Amazonia (Bates). In Mus. Hopeiano Oxonie.

The antennæ in the specimen figured are 11-jointed, but the second joint is very short, the third annulariform and almost indistinct, the four following joints large and of equal size, and the remaining three forming an oval mass not larger than the preceding joint.

#### GENUS—POLYCHROMA.

*Chalcolecti* Wlk. affinis: corpus crassum; caput antice excavatum; oculi magni; antennæ mediocres 11-articulatae, articulo primo longo, secundo praecedentis dimidium longitudine sere squanti, tertio dimidium secundi, ultimis 8 sensim crassioribus, ultimo truncato, angulo supero in spinam brevem terminato; collare minutum; parapsides mesonoti bene distincti; postacetellum magnum; alis antice vena radiali e subcostali haud valde remota; pedes 4 antice inermes; postici 2 coxis magnis, femoribus clavatis, subtus spinosis, tibiis curvatis; abdomen ovale apice acuto.

## SPECIES 1—POLYCHROMA HISTRIONICA.

## PLATE XXVI, FIG. 6.

*Punctata, viridis, purpureo cupreoque variegata : antennis nigricantibus ; femoribus anticis basi cæruleis, apice, tibiis anticis, pedibus totis intermediis, tibiisque posticis fulvis ; tarsis fuscis articulo basali albido : femoribus posticis cæruleis, subtus spinis 11 armatis ; alis hyalinis parum fuscouscentibus, apicibus iridescentibus.*

Long. corp. lin. 4 ; expans. alar. antic. lin. 7 $\frac{1}{2}$ .

Habitat; Brazil? In Mus. W. W. Saunders.

The head and collar of this very beautiful insect are green, finely punctured ; the mesonotum is green, with a large coppery-purple spot in front, and a larger one between the parapsides, the sides of which are tinged with the same coppery-purple, which is also the colour of the large scutellum, which is marked with two oval green spots. The abdomen is chalybeous, very glossy, and varied with green and coppery-red and orange, of which colours are two large spots on the fifth and sixth segments of the abdomen ; the sixth segment has a large spiracle near each of the anterior lateral angles. The antennæ (fig. 6a) have the basal joint long, the second moderately long and slender, the third and following gradually becoming shorter and somewhat broader, the last (eleventh joint) being the shortest and truncate at the tip, the apex being furnished with a small spur or spine on its under side. The hind femora are large and clavate, armed on the under side with eleven teeth, of which the middle ones are the largest. The curved tibiae are received into a groove on the under side of the thighs, the inner edge of which groove is furnished with a row of eight small tubercles (fig. 6b).

## SPECIES 2—POLYCHROMA REGALIS.

## PLATE XXVI, FIG. 7.

*Viridis, punctata, purpureo rufo-cupreoque variegata : scutello magno rufo-purpureo ; antennis nigris, articulis duobus basalibus rufis ; femoribus purpureo-piceis ; tibiis fuscis, basi et apice posticarum tarsiisque albidis ; abdominis segmentis primo, quinto et sexto, utrinque macula cupreo viridique tincta ornatis ; alis fuscouscenti-hyalinis apice iridescentibus ; femoribus posticis subtus denticulis circiter 26 armatis.*

Long. corp. lin. 3 $\frac{1}{2}$  ; expans. alar. antic. lin. 6.

Var. minor, paullo obscurior, femoribus posticis 24–25-denticulatis.

Habitat; Amazonia (D. Bates). In Mus. Hopeiano Oxoniæ.

This lovely insect differs from the preceding in the structure of the hind thighs, which are armed with a row of minute teeth, twenty-six in number, on each side of the groove, for the reception of the hind tibiae (fig. 7a). The antennæ are destitute of the minute annular joints succeeding the second joint found in so many species of the family : they are distinctly 11-jointed, the eighth being the thickest and the eleventh the smallest, with a minute curved spur at its apex. The front of the mesonotum, the fore margins of the parapsides, and the large scutellum, with its lateral lobes, are rich coppery-purple.

## SPECIES 3—POLYCHROMA 16-DENTATA.

*Capite et thorace senis obscuris, purpureo parum tinctis, punctatissimis ; abdome chalybeo, nitidissimo, segmentis intermediis purpurascensibus basi transverse striolatis, sexto utrinque puncto impresso ; antennis nigris, 11-articulatis, articulis quarto, quinto et sexto fulvis ; pedibus nigro-piceis ; tarsis luteis apice fuscis, femoribus posticis incrassatis, subtus 16-denticulatis ; alis hyalinis, anticis nubila magna brunnea pone medium posita.*

Long. corp. lin. 4 ; expans. alar. antic. lin. 7.

Habitat; Brazil, Para (Bates). In Mus. W. W. Saunders.

## SPECIES 4—POLYCHROMA 7-DENTATA.

Capite *sæno*, facie aurea, occipite nigricante; antennis nigris; thorace rude punctato; mesothorace cæruleo-viridi, dorso cupreο; scutello magno convexo, purpureo, apice viridi; abdomen elongato-conico, nitidissimo, dorso chalybæo-purpureo versus basin magis cuprescenti, basi ipsa magis aureo-viridi, apice nigro; pedibus 4 anticis chalybæo-nigris; tarsis articulo basali albido; coxis posticis viridi-cæruleis nitidis, femoribus cupreis, clavatis, subtus 7-dentatis; tibiis posticis *sæneis* basi fulvis; tarsis albis apice fuscis; alis hyalinis.

Long. corp. lin. 3; expans. alar. antic. lin. 4½.

Habitat; Amazonia (Bates). In Mus. Hopeiano Oxonie.

## SPECIES 5—POLYCHROMA CUPRESCENS.

Capite et thorace obscure-sæneis, punctatissimis; scutello cuprescente; metathorace cæruleo-viridi, basi aureo purpureo tincto; antennis nigris, articulis intermediis fulvis; pedibus 4 anticis nigro-sæneis; tarsis basi albis; pedibus posticis, cum coxis et femoribus, nigro-sæneis; tibiis basi articuloque basali tarsorum albis, femoribus posticis clavatis, 16-denticulatis; alis hyalinis; pone medium parum fuscescentibus.

Long. corp. lin. 3; expans. alar. antic. lin. 4½.

Habitat; Australasia, Melbourne (D. Bakewell). In Mus. Hopeiano Oxonie (olim nostr.).

## GENUS—PELECINELLA.

(Westw. Trans. Ent. Soc. Lond. 1868, Proc. p. 35.)

Callimomi affine: corpus formæ longissimum, fere filiforme; caput subgloboseum; antennæ (fig. 8 a) thoracis longitudine 11-articulatae, articulis secundo et tertio minutis, quarto longo subcompresso, reliquis sensim decrescentibus; collare capite duplo longius valde angustatum; abdomen longissimum, gracillimum, segmentis secundo et tertio parum crassioribus, reliquis compressis; apice lobis 2 magnis foliaceis terminato (figs. 8 b, 8 c \*\*), oviductus exsertus fere abdominis longitudine curvatus; alæ anticæ ramo stigmatali fere punctiformi; pedes 4 antici graciles; 2 postici apice tibiarum et articulo basali tarsorum dilatatis.

## PELECINELLA PHANTASMA.

(Westw. Trans. Ent. Soc. Lond. loc. cit. p. 36.)

## PLATE XXVI, FIG. 8.

Nigra, punctata: abdome chalybæo; collaris lateribus rufis, abdome nitido; pronoto, metanoto et petiolo transverse striatis, segmento sequente purpureo; alis translucidis; tarsorum posticorum articulis 4 apicalibus albis.

Long. corp. lin. 12; expans. alar. antic. lin. 7½.

Habitat; ad ripas flum. Amazonum (Bates). In Mus. Hopeiano Oxonie.

## GENUS—THAUMASURA.

(Westw. Trans. Ent. Soc. Lond. 1868, Proc. p. 36.)

Cleonymo et Epistenæ affine: antennæ (fig. 9 a) graciles 11-articulatae, articulo secundo mediocri, tertio minuto, quarto longo, reliquis sensim attenuatis; thorax subovalis; abdomen segmentis 5 basalibus brevibus, massam ovalem fingentibus; duobus apicalibus gracillimis tubulum capite et thorace duplo longiore pro receptione oviductus formantibus; alæ anticæ ramo stigmatali brevi, apice furcato; femora compressa; tarsi simplices; oviductus abdome a quarta parte longior.

The mandibles (fig. 9 a) are trigonate, the inner margin obtusely 8-dentate; the maxillary palpi (fig. 9 b) with the second and fourth joints elongate; the labial palpi (fig. 9 c) apparently only 2-jointed.

## THAUMASURA TEREBRATOR.

(Westw. Trans. Ent. Soc. loc. cit.)

## PLATE XXVI, FIG. 9.

*T. purpureo-chalybea*, punctata: metathoracis lateribus et abdominis basi cupro tinctis; antennarum articulis intermediis pedibusque rufis, alis anticis sub stigmate fusco parum nebulosis; abdominis segmento sexto 5 precedentibus simul sumptis longitudine aequali, septimo longiore et tenuiore; tibiis posticis extus curvatis serrulatis.

Long. capitis, thoracis et segm. 5 basal. abdom. lin. 5; segm. 2 apical. abdom. lin. 7; expans. alar. antie. lin. 9 $\frac{1}{2}$ .

Habitat; Australasia, partib. Austral. In Mus. Hopeiano Oxoniæ (olim nostr.).

## GENUS—SOLENURA.

(Westw. Trans. Ent. Soc. Lond. 1868, Proc. p. 36.)

*Thaumasura affine*: antennæ (fig. 10 a) capite vix duplo longiores, 11-articulatae, apicem versus paulo crassiores articulo secundo parvo, tertio minuto; corpus breve compactum; abdomen segmentis 3 basalibus massu elongato-ovalem, thoracis magnitudine formantibus, reliquis tubulatis; quarto 3 basalibus simul sumptis longitudine aequali, cylindrico, quinto precedente duplo breviore, sexto 4 basalibus simul sumptis aequali, septimo minuto; terebra paulo ultra abdominis apicem extensa (fig. 10 b apex abd. latere visus); pedes breves simplices.

## SOLENURA TELESCOPICA.

(Westw. Trans. Ent. Soc. loc. cit.)

## PLATE XXVI, FIG. 10.

*S. chalybea punctatissima*: abdomine purpurascente; segmento tertio et sequentibus carina media distinctis; antennis nigris, pedibus obscure rufis; alis immaculatis.

Long. capitis, thoracis et segm. 3 basal. abdom. lin. 4; segm. 4 apical. abdom. lin. 7; expans. alar. antie. lin. 7.

Habitat; Java (D. Horsfield?). In Mus. Hopeiano Oxoniæ.

## GENUS—EUCHARISSA.

(Westw. Trans. Ent. Soc. Lond. 1868, Proc. p. 36.)

*Euchardi affine*: caput transversum antice dense lanatum; antennæ capite duplo longiores 16–22-articulatae, plumosse vel serratae; thorax subglobosus; abdomen brevissimum petiolo brevi; pedes breves simplices.

OBS.—This is the only genus in the whole of the immense number of species forming the family Chalcididæ, which has the antennæ formed of more than thirteen joints.

## SPECIES 1—EUCHARISSA SPECIOSA.

(Westw. Trans. Ent. Soc. 1868, Proc. p. 37.)

## PLATE XXVII, FIG. 3.

Antennæ 22-articulatis (fig. 3 a), nigris; capite et thorace late viridibus, hoc antice canaliculato et transverse striato; abdome et pedibus luteis, femoribus et petiolo obscurioribus; alis pallide fuscouscentibus.

Long. corp. lin. 4; expans. alar. lin. 10.

Habitat; Cape of Good Hope. Mecum communicaverunt D.D. Klug (cum nomine ‘*Eucharis speciosa*,’ Kl. MS.) et March. Maxim. Spinola.

## SPECIES 2—EUCHARISSA NATALICA.

(Westw. l. c.)

*E. antennis 16-articulatis, nigris; sena, areolato-punctata; abdomine nigro nitido, postice luteo; pedibus albidis; femorum basi fusca.*

Long. corp. lin. 2 $\frac{1}{2}$ ; expans. alar. antic. lin. fere 6.

Habitat; Natalia. In Mus. Hopeiano Oxonise (olim nostr.)

## SPECIES 3—EUCHARISSA STIGMATICA.

PLATE XXVII, FIG. 2.

*Viridia, ruda punctata: thorace brevi ovali, convexo, antice haud canaliculato; abdomine compresso ovali aurato-viridi, pedunculo mediocri; antennis nigris 22-articulatis, articulo, tertio et reliquis biramosis, ramis internis brevioribus (fig. 2 a); externis ante apicem spinula armatis; pedibus albidis femoribus nigricantibus apicibus pallidis; alis brunneo subhyalina, stigmate et vena stigmaticaliter fusca.* (Mas.)

Long. corp. lin. 3; expans. alar. antic. lin. 6 $\frac{1}{2}$ .

Habitat; Caffraria. In Mus. Reg. Holm. Dom. Stälio mecum benevoli communicata.

## SPECIES 4—EUCHARISSA CUPRIFBONS.

*Capite cupreо, lateribus levibus; antennis nigris, 18-articulatis articulis 3–18 intus in ramulum acutum productis; thorace sureo-viridi convexo, antice haud longitudinaliter canaliculato, transverse striolato, et in medio cupreо antice tincto; scutello valde convexo; pedunculo abdominalis coxisque posticis viridibus; pedibus luteis, femoribus (apicibus exceptis, nigris, unguibus et pulvillis tarsorum nigris; alis et stigmate ut in *E. stigmatica* coloratis; abdomine luteo-fusco nitidissimo.* (Fem.)

Long. corp. lin. 3; expans. alar. antic. lin. 6 $\frac{1}{2}$ .

Habitat; Caffraria. In Mus. Reg. Holm.

## GENUS—PRIONOPELMA.

(Westw. Proc. Zool. Soc. April 14, 1835, No. 28, p. 51.)

*Caput latum, antice subtridentatum; antennae 11-articulatae; articulis secundo et tertio fere aequalibus, minutis, reliquis 8 longitudine sensim decrescentibus; abdomen subcassile, oviductu corpore fere duplo longiore, vaginalis pilosis; pedes graciles, intermediis crassioribus cum tibiis paullo curvatis, calcari valido armatis; tarsis intermediis dilatatis.*

OBS. 1.—Hoc genus oviductu elongato Callimomem cum Eupelmo (pedibus intermediis) conjungit.

OBS. 2.—Genus Phlebopenes, (Perty), Del. An. Art. Brasiliæ, p. 132, pl. XXV, fig. 11, his insectis etiam affine; differt, secundum descriptionem auctoris laudati, antennis filiformibus tantum 9-articulatis, primo satis elongato, secundo valde brevi, sequentibus indistinctis, ultimis involutis; femoribus etiam compressis, mediis apicem versus paullo dilatatis; an Callimomi conjungendum?

## SPECIES 1—PRIONOPELMA VIRIDIS.

(Westw. Op. cit. supra.)

*Aureo-viridis parpureo nitens; abdomine nitido, femoribus viridi-nigris; tibiis tarsisque obscurioribus, geniculis pedum intermediorum albidis; antennis nigris; alis pallide fulvescentibus, in medio paullo obscurioribus, venis fusca.*

Long. corp. lin. 3 $\frac{1}{2}$ ; oviductus 5 $\frac{1}{2}$ ; expans. alar. antic. lin. 6.

Habitat; Brazilia. In Mus. Dom. Hope.

## SPECIES 2—PRIONOPELMA LONGICAUDATA.

## PLATE XXVII, FIG. 4.

*Viridis: abdomine chalybeo, basi fulvo; oviductu longissimo toto corpore fere quintuplo longiori, supra recurvo; thorace antice retuso, mesonoto antice declivi, rugis transversis delicatulis subtriatis; facie pone antennas purpureas in medio depressione parva rotundata, nec canaliculata; antenais 11-articulatis, filiformibus, nigris, articulo basali basi fulvo, secundo et tertio parvis fere aequalibus, ultimis sensim brevioribus et gracilioribus; collare et mesonoto antice purpureis, hujus dorso maculis duabus nigris oblongis; scutello punctato; lateribus thoracis sub alas purpureis; abdominis segmento basali fulvo-ruso, ultimo viridi; femoribus anticis nigris, viridi-tinctis; tibiis tarsisque fulvo-fuscis, illis subtus linea obscuriori media notatis; femoribus mediis luteis, tibiis fulvis, apicibus tarsisque fuscis; femoribus posticis fulvis, tibiis tarsisque nigris; alis pallide fuscescentibus; abdomine subtus articulis tribus basilibus fulvis, reliquis aureo-viridibus.*

Long. corp. lin. 4; oviduct. lin. 19; expans. alar. antec. lin. 7½.

Habitat; Para (Bates). In Mus. Britann.

## SPECIES 3—PRIONOPELMA LONGICOLLIS.

## PLATE XXVII, FIG. 1.

*Cærulea, viridi parum tincta: lateribus thoracis pedibusque omnibus brunneo-fulvis; capite splendide viridi, occipite et margine postico punctis minutis, facie majoribus; mandibulis antennisque nigris, harum articulis primo et secundo cæruleis; collari splendide purpureo impunctato, profunde semicirculariter impresso; mesonoto oblongo viridi, minute punctato, purpureoque tincto, maculis duabus oblongis nigris transverse striatis; abdome chalybeo nitido lateribus viridibus, apice purpureo; subtus in medio fulvo; oviductus vaginis nigris setosis, corpore triplo longioribus; prosterno viridi; pedibus (coxisque pedum anticum) fulvo-rufis; coxis posticis supra viridibus, infra aurantiis; alis hyalinis praesertim basin versus melleo tinctis, venis fuscis, nebulisque longitudinalibus paullo obscurioribus; antennis gracilibus 11-articulatis (fig. 1 a); tibiis mediis calcari magno tarsisque crassioribus instructis (fig. 1 b.)*

Long. corp. lin. 6½; oviduct. lin. 21; expans. alar. antec. lin. 9½.

Habitat; Para (Bates). In Mus. Britann.

## GENUS—OODERA.

Prionopelma affine, differt pedibus anticis raptoris, collare elongato locoque natali orientali. Caput antice bicanaliculatum; antennæ longæ filiformes 11-articulatæ, articulis secundo et tertio brevibus, quarto longo, quinto et reliquis sensim brevioribus et paullo gracilioribus; collare oblongo subovale postice contractum; meso- et metathorace massam oblongo-ovalem postice truncatam formantibus; abdomen elongatum, basin versus apiceque angustatum; oviductus fere corpore toto longitudine aequalis; pedes antici subraptorii; coxis elongatis, femoribus clavatis subtus spinulis minutis armatis; tibiæ mediæ ad apicem crassiores, calcari magno instructæ; tarsi medii ad basin subtus paullo dilatati; pedes postici longi simplices.

## SPECIES 1—OODERA GRACILIS.

## PLATE XXVII, FIG. 9.

*Cæruleo-purpurea, thoracis dorso viridi, nigro variegata, delicate punctata: abdome nitido cæruleo basi purpurascente; pedibus anticis viridi-cæruleis, intermediis obscure cæruleis, geniculis calcaribusque brunneis, posticis cæruleis femoribus rufis; alis fusco-hyalinis.*

Long. corp. lin. 7½; oviduct. lin. 6; expans. alar. antec. lin. 9½.

Habitat; Rosenberg, Aru. In Mus. Hopeiano Oxoniæ, e Mus. Reg. Lugdunensi mihi benevole communicata.

## SPECIES 2—OODERA RUFIMANA.

Capite antennisque nigris, articulo secundo piceo; collare purpurascente, transverse striatulo, lateribus in medio angulatis; thorace punctato viridi, parapsidibus mesonoti et postescutello cuprescentibus; abdomine longo, depresso chalybeo, lateribus viridi nitentibus; oviductu collari duplo longiori nigro; coxis anticis sexatis, femoribus testaceis supra seneo-nitidis, subtus setis nigris marginatis; tibiis tarsisque fulvis; pedibus intermediis obscure fulvis, tibiis ante apicem obscurioribus; pedibus posticis obscure testaceis; femoribus versus apicem piceis, apice ipso albido, tibiisque ante apicem obscurioribus; alis subhyalinis venis fuscocentibus; anticis nubila media paullo obscuriora.

Long. corp. lin. 5; oviduct. lin. 1; expans. alar. antic. lin. 6.

Habitat; Cambogia (Mouhot). In Mus. W. W. Saunders.

## SPECIES 3—OODERA OBSCURA.

Tota obscure ænea: abdomine breviori depresso chalybeo, oviductu brevissimo; trochanteribus 4 posticis, tarsisque omnibus albidis apice fuscis; alis hyalinis venis nigricantibus.

Long. corp. lin. 2½; expans. alar. antic. lin. 3.

Habitat; —? In Mus. W. W. Saunders.

## GENUS—BELONEA.

Præcedentibus affine: caput transversum; antennæ (fig. 5 e) graciles sat longe, 11-articulatae, articulo primo longo, secundo elongato, tertio brevissimo, quarto ad apicalem modice elongatis, sensim brevioribus et gracilioribus; collare transversum medio antice angulariter productum; abdomen elongatum obconicum, segmento ultimo in tubulum elongatum producto, oviductus apicem columnam tegente; pedes antici longi, femoribus crassis subtus prope apicem incisis, pedes intermedii longi simplices; postici femoribus brevioribus crassis et curvatis subtus inermibus; tibiis tarsisque elongatis.

## SPECIES 1—BELONEA AUSTRALICA.

## PLATE XXVII, FIG. 5.

Nigra punctata: abdomine puniceo-rubo nitidissimo, segmentis secundo, tertio et quarto parum transverse subrugosis; antennis nigris, articulis tertio, quarto et quinto pedibusque rufis; coxis posticis nigris; alis hyalinis maculis duabus discoidalibus nebulaque longitudinali pallidiori fuscis.

Long. corp. lin. 6½; expans. alar. antic. lin. 7.

Habitat; South Australia (Damell). In Mus. Hopeiano Oxonie.

## SPECIES 2—BELONEA FEMORALIS.

## PLATE XXVII, FIG. 7.

Obscure purpureo-nigra, viridique variegata: thorace opaco; antennæ nigris, medio albidis; pedibus viridibus, femoribus rufis; alis hyalinis pallide lutescentibus, maculis duabus rotundatis fuscis; capite postice declivi, obscure purpureo; antennarum articuli quarti dimidio apicali, quinto et sexto albidis, reliquis 5 sensim brevioribus et tenuioribus; collare transverso, carina media acuta, maculis duabus mesonoti et metanoto obscure viridibus; abdomine nitidissimo, nigro-chalybeo, basi purpurascenti, segmentis intermediiis utrinque macula sericea viridi vel cœrulea notatis; elongato, sensim acuminato, segmento ultimo tubulum tenuem longum formante; oviductu ultra apicem tubuli duas lineas extenso; pedibus valde elongatis, femoribus anticis parum incrassatis

subtus ante apicem incisis; tibiis intermediis calcari uno instructis, articulo basali tarsorum intermediorum vix reliquis crassiori basi albido.

Long. corp. lin. 4½–6½; tubuli lin. 1½–2½; oviduct. apic. lin. 1½–2; expans. alar. antic. lin. 7–10½.

Habitat; New Guinea, Mysol, Aru (Wallace). In Mus. W. W. Saunders.

OBS.—Mas differt magnitudine multo minori, femoribus praesertim posticis crassioribus abdomineque e segmento basali et tubulo apicali tantum, ut videtur, constanti, illo plano nitidissimo thorace angustiori et multi (fere dimidio) breviori, apice in medio marginis postici angulato, lateribusque deflexis et angulato productis: tubuloque apicali (longitudine capitinis et thoracis) valde angusto piano, ut videtur exarticulato, apice deflexo et acuto.

Long. corp. cum tubulo apicali lin. 3½–5½.

Habitat; Waigiou (Wallace). In Mus. Hopeiano Oxoniæ et W. W. Saunders.

#### SPECIES 3—*BELONEA BREVICAUDATA.*

Præcedenti maxime affinis at minor: abdomine breviore; pedibus magis rufis, tubulo apicali abbreviato; oviductu pone tubulum vix quartam partem lineæ extenso.

Long. corp. cum oviduct. lin. 4½.

Habitat; Mysol (Wallace). In Mus. W. W. Saunders.

#### GENUS—*LYCISCA.*

(De Romand, Guérin, Mag. de Zool. 1840, pl. XLIII; Proglostis, Philippi in Stettin, Ent. Zeit. vol. xxxii. p. 288.)

Antennæ breves 11-articulatæ, articulo secundo fere tertiam partem articuli primi sequanti; tertio minuto, quarto secundo parum longiori, quinto et reliquis longitudine parum decrescentibus, ultimo indiviso apice acuminato; collare quadratum, longitudine latitudinem ejus sequanti, aut antice parum attenuatum; meso- et metathorax massam oblongam formantes; abdomen elongatum depresso, segmentis apicalibus subito angustatis et elongatis; pedes graciles femoribus anticis clavatis intus prope apicem emarginatis; tibiæ et tarsi intermedii simplices.

This genus is very nearly allied to *Cleonus Latr.*, *Hetroxys Westw.*, and especially to *Epistenia Westw.* which is a shorter and more compact form, but with similarly formed 11-jointed antennæ, and with the three terminal segments of the abdomen attenuated.

#### GENUS—*EPISTENIA.*

(Westw. in Griffith, Animal Kingdom, Insecta, vol. ii. p. 432.)

Antennæ 11-articulatae, articulo secundo mediocri, tertio parvo, quarto secundo majori, reliquis 7 subequalibus, ultimo indiviso; facies in medio canaliculata; collare breve transversum capite paullo angustius; thorax subquadratus; abdomen subelongatum depresso, segmentis quinto et reliquis subito angustatis, caudam brevem fornantibus; pedes graciles, antici femoribus simplicibus.

#### SPECIES 1—*EPISTENIA CÆRULEATA.*

(Westw. in Griffith, Animal Kingdom, l. c. supra, pl. LXXVII, fig. 3.)

Luteo cœrulea, viridi purpureoque parum tincta, rude punctata: segmento basali abdominis subnitido, obscure sanguineo; pedibus pallide testaceis, unguibus nigris; alis pallide luteo-fusco-hyalinis parum iridescentibus, venis fuscis, lateribus thoracis et abdominis albo setosis; collare transverso, femoribus anticis vix incrassatis.

Long. corp. lin. 5½; expans. alar. antic. lin. 5½.

Habitat; Georgia, America. In Mus. Britann.

## SPECIES 1—LYCISCA RAPTORIA.

(De Romand, l. c. supra.)

Habitat; Cayenne. Olim in Mus. de Romand.

## SPECIES 2—LYCISCA ROMANDI.

(Westw. in Guérin, Mag. de Zool. 1841, Insectes, pl. LXXXIV.)

Cæruleo-nigra, punctatissima: capite postice et ad marginem internum oculorum aureo-viridi; antennis nigris; collaris margine postico, parapsidum et parapterum marginibus metathoraceque aureo-viridibus; abdome supra plano, punctato, lateribus inflexis, supra cæruleo-nigro, apicibus segmentorum nitidissimis, subtus marginibus segmentorum aureo-viridibus et punctatis; pedibus brunneis; alis pallide infumatis, maculis duabus brunneis, subcostalibus postice lunula pallidiori connexis.

Long. corp. lin. 8; expans. alar. antic. lin. 9.

Habitat; Cayenne. Olim in Mus. de Romand, etiam in Mus. W. W. Saunders et Miers: indiv. in Mus. W. W. Saundersii abdomen habet longius et magis attenuatum quam in *L. ignicaudata*.

## SPECIES 3—LYCISCA IGNICAUDATA.

PLATE XXVII, FIG. 10.

Elongata, purpureo, chalybæo, viridi, cæruleo que variegata: antennis nigris 11-articulatis apice sensim crassioribus (fig. 10 a); segmentis apicalibus abdominis igneis; pedibus viridi-nigris, femoribus rufis apice viridibus; alis nubila magna media curvata extus dilatata, fuscescente; facie utrinque sulcata; collare subtrigono utrinque impresso, mesonoto fascia media interrupta viridi, metanoto in medio cæruleo, lateribus viridibus; abdomine cyaneo-purpurascente fascia sericea viridi ad basin segmenti tertii maculisque duabus rotundatis lateralibus segmenti quarti ejusdem coloris, dimidio apicali segmenti quinti et reliquis igneo-rufis ultimis valde attenuatis, sexto ad basin utrinque puncto rotundato instructo, septimo subtus utrinque producto et ad apicem octavi extenso (fig. 10 b, abdomen e latere viso).

Long. corp. lin. 7½; expans. alar. lin. 9.

Habitat; Para, Brazil (Bates et alior.) In Mus. Hopeiano Oxoniæ.

The abdomen is equal in length to one and two-thirds of the thorax, and the wings and abdomen are of equal length. The lateral view of the latter is given in fig. 10 b, shewing the remarkable structure of the terminal segments, the penultimate being extended as far as the extremity of the terminal joint, which, as well as the antepenultimate, is furnished with a minute spiracle on each side.

## SPECIES 2—EPISTENIA (Westw.) IMPERIALIS.

(Smith, Proc. Linn. Soc. vol. ii. p. 127.)

Capite thoraceque purpureis, rudo punctatis; alis hyalinis; abdomine versicolori, segmentis apicalibus basi testaceis. Long. 7½ lines.

Habitat; Sarawak, Borneo.

Head and thorax of a rich purple, the metathorax with tints of bright green, the legs black, the apex of the joints rufo-piceous, as well as the apical joints of the tarsi. Abdomen of changeable hues, partaking of tints of blue, purple, violet, or green in different lights; the three basal segments deeply emarginate above, with central longitudinal depressions extending to their base; the ovipositor thick and pubescent, two-thirds of the length of the abdomen.

Appears to belong to Genus Epistenia, established by Westwood in Griffith, Animal Kingdom; if not, it is very closely allied.'

## SPECIES 4—LYCISCA (?) NATALENSIS.

## PLATE XXVII, FIG. 6.

Purpureo-cuprea, viridi variegata : abdomine nitido purpurascente-chalybæo ; capite viridi ; antennis (fig. 6 a) 14-articulatis, nigris, articulis 7, 8, et 9 albis, articulo secundo brevi, tertio brevissimo, quarto longo, reliquis ad apicem sensim brevioribus, ultimo parvo conico ; collare magno, ovali ; abdomine obovato, depresso ; alis pallide hyalinis, anticis punctis duobus subcostalibus ante medium maculaque magna pone medium fuscis ; pedibus anticis coxis magnis, femoribus incrassatis subtus ante apicem emarginatis, testaceis viridi nitidis ; femoribus posticis testaceis ; tibiis viridescentibus ; tarsis lutescentibus. (Mas.)

Long. corp. lin. 8 ; expans. alar. antic. lin. 4.

Habitat ; Natalia. In Mus. Hopeiano Oxonie.

The African locality and the structure of the antennæ remove this insect from the other species of the genus. I am only acquainted, however, with females of the American species, and with the male of this African one.

## SPECIES 5—LYCISCA MACULIPENNIS.

(*Proglachis maculipennis*, Philippi in Stettin, Ent. Zeit. vol. xxxii. p. 289, and plate annex., fig. 3.)

Capite, mesonoto et scutello rube punctatis, rufo-cupreis ; capite infra zeno ; metanoto et abdomine metallico-ceruleis, apice nigris ; mesosterno et coxis zucis, ventre violaceo ; antennis nigris ; pedibus rufescentibus ; alis hyalinis, anticis fuscoc-bimaculatis ; abdomine thorace quadruplo longiori.

Long. corp. 8 lin. = 17 mill. ; expans. alar. antic. lin. 7  $\frac{1}{4}$  = 16 mill.

Habitat ; Chili, near Los Ulmos, in Prov. Valdivia.

## GENUS—METAPELMA.

(Westw. Proc. Zool. Soc. 26 May, 1835, No. 29, p. 69.)

Thorax ante alas elongatus, declivis ; antennæ 11-articulatæ, graciles fere thoracis longitudine apicem versus paullo crassiores, apice ipso oblique truncato ; abdomen compressum, oviductu exerto, abdominis longitudine ; pedes intermedii longiores, femoribus paullo retro-curvatis ; tibiis calcari longo instructis ; tarsis vix dilatatis subtus ciliatis, articulo primo longiore ; postici crassiores tibiis tarsorumque basi valde dilatatis compressis.

OBS. 1.—Genus Eupelmo <sup>1</sup> affine.

OBS. 2.—Dua species hujus generis, Europe meridionalis incolæ, a cel. Försterio editæ sunt.

## SECTION 1—SPECIES AMERICANA.

## SPECIES 1—METAPELMA SPECTABILIS.

(Westw. Op. cit. p. 69.)

Capite thoraceque viridibus, cupreo-nitentibus ; antennis nigris ; abdomine nigro, chalybæo purpureoque nitente ; pedibus quatuor anticis ferrugineis viridi subnitentibus ; tarsis intermediis fuscis ad basin albidis ;

<sup>1</sup> Speciem permagnam hujus generis in Mus. Dom. W. W. Saunders hic describam :—

## EUPELMUS EXCELLENS.

Viridis : thorace sericeo ; mesonoti parapsidibus anticè declivibus purpureo longitudinaliter vittatis ; abdomine elongato depresso, thorace parum angustiore, lateribus fere parallelis, chalybæo-nigro lateribus apiceque aureo-viridibus ; antennis nigris, articulo basali viridi ; pedibus nigris, intermediis rufis ; tibiis sensim crassioribus apice nigro ; tarsis intermediis compressis, nigris, articulo basali lato, reliquis ad apicem attenuatis ; alis lutescentibus.

Long. corp. lin. 4  $\frac{1}{2}$  ; expans. alar. antic. lin. 6.

Habitat ; Brazil, Para (Bates). In Mus. D. W. W. Saunders.

pedibus duobus posticis fuscis, femoribus basi rufis; tibiis basi albis; oviductu nigro; alis pone medium nubecula vix infumata.

Long. corp. lin. 2 $\frac{1}{2}$ ; oviduct. lin. 1; expans. alar. antic. lin. 3 $\frac{1}{2}$ .

Habitat; Georgia, America. In Mus. Britann.

## SECTION 2—SPECIES ASIATICÆ.

### SPECIES 2—METAPELMA GLORIOSA.

PLATE XXVII, FIG. 8.

*Xmas*, ceruleo parpureo et cupreо variegata: antennis nigris, 11-articulatis (fig. 8 a) articulis secundo et tertio brevibus, quarto longo, reliquis sensim brevioribus et crassioribus; capite sub lente minutissime granulato punctisque majoribus, facie albo sericanti; collari trigono; abdomine segmentis intermediis utrinque cernulo maculatis, oviducta abdomine cum thorace longitudine sequenti; calcari et tarsis intermediis (basi crassis) rufescens; tibias posticis nigris basi albis, dimidio apicali membrana magna extrema rotunda nigra instructis; tarsis albis, basi articali primi et apice ultimi nigris; alis pallide hyalinis, apicibus obscurioribus.

Long. corp. lin. 5; oviduct. lin. 4 $\frac{1}{2}$ ; expans. alar. antic. lin. 8.

Habitat; Insula Philippinensis, Lason, Camiguin (D. Semper). In Mus. D. Semper, Altome.

### SPECIES 3—METAPELMA RUFIMANA.

Præcedenti multo minor et obscurior at simillima: tibias posticis fere e basi sensim dilatatis; pedibus quatuor anticis rufis; oviducta breviori; alis anticis apice fuscis; mesonoto magis cupreо-purpurascenti.

Long. corp. lin. 3; long. oviduct. lin. 1 $\frac{1}{2}$ .

Habitat; Sarawak, Borneo (Wallace). In Mus. W. W. Saunders.

### SPECIES 4—METAPELMA TAPROBANÆ.

Thorace nigro, nuno et cupreо variegata; abdomine piceo, basi supra cupreо parum tineto; mesopleuris macula elongato-conica alba notata; pedibus 4 anticis rufis, tarsis nigris, articulo primo ad basin albo; coxis pedum 2 posticorum nuncia, femoribus nigris, basi albis; tibias in spatuam rotundam elevato-compressis, nigris, basi albis; tarsis posticis albidis, dimidio basali articali primi articuloque ultimo nigris.

Long. corp. lin. 5; oviduct. lin. 2 $\frac{1}{2}$ ; expans. alar. antic. lin. 6 $\frac{1}{2}$ .

Habitat; Ceylon. In Mus. Reg. Hafniae.

### SPECIES 5—METAPELMA OBSCURATA.

Nigra, subnnea, purpureoque parum tineta: metathorace magis nuno; abdomine subchalybeo nitido; thorace breviore et angustiore, supra pleno apice acuto; mesothorace latitudine longiore, parapsidibus elevatis longis et parallelis, scutoque inter parapsides angusto utrinque sulcato; oviductu abdomine dimidio breviro; antennis pedibusque nigris, intermediis elongatis femoribus apice albidis; tibias piceis calcari longo articuloque basali tarsorum albidis, hoc compresso, reliquis ad apicem attenuatis; pedibus posticis compressis, femoribus parum elevatis apice albo, tibias dilatatis femoribus latioribus, nigris basi albis, tarsis compressis e basi ad apicem sensim angustioribus; alis pallide hyalino-fuscescentibus.

Long. corp. lin. 3; oviduct. 3 lin.; expans. alar. antic. lin. 4.

Habitat; India Orientalis. In Mus. Hopeiano Oxonie.

## SUB-FAMILY—EUCHARIDES.

The twenty-eighth Plate of this work is devoted to a series of remarkable insects belonging to the family Chalcididæ, closely allied to the Eurytomides, but in general distinguished by the great, and often abnormal development of the hinder parts of the thorax, and often also by the strongly pectinated antennæ of the males. The typical genus is *Eucharis* of Fabricius, but several others have been separated, including *Thoracantha* Latr., *Stilbula* Spinola, *Schizaspidia* Westw., and *Callaria* Brullé; (*Psilogaster* Blanchard is identical with *Stilbula*).

The generic distribution of the group is, however, at present unsettled, and can only be established upon a more careful investigation of the characters of the species than has hitherto been given to them; thus, in the typical species *Eucharis adscendens*, a native of Europe, and also introduced into the British list, I have been unable, after repeated dissections, to discover any normally formed maxillæ or labium, the mouth being apparently closed by membrane; the mandibles of this species are represented in pl. XXVIII, figs. 15 a ♀, 15 b ♂. In the insect figured under the name of *Schizaspidia rufa* (fig. 5), the mandibles are armed with strong teeth (fig. 5 b), and the maxillæ and labium, with their palpi (figs. 5 c, 5 d), are well developed. The antennæ vary in nearly every species, as may be observed on inspecting the twenty-eighth plate, in which I have added figures of the antennæ of several species not represented; thus, fig. 15 c represents the antennæ of the male, and 15 d, that of the female, of the type, *Eucharis adscendens*. Fig. 13 represents the 12-jointed antenna of the male of *Eucharis Volusus* (Entomologist, pl. P, fig. 1 c); the intermediate joints being bifurcate, with the inner branch shorter than the outer. Fig. 14 a represents the antenna, apparently 9-jointed, of the male, and 14 c, that of the female, apparently 11-jointed, of *Eucharis Zalates* (ibid. fig. 4 a, and fig. 4 b), in both of which the last apparent joint (or more probably only that of the male) is made up of the three ordinary terminal joints closely soldered together.

## GENUS—SCHIZASPIDIA.

(Westw. Proc. Zool. Soc. 26 May, 1835, p. 69.)

Corpus breve crassum; antennæ breves crassæ, 13-articulatae, articulis secundo et tertio fere squalibus, quarto ad decimum interne serratis, reliquis 3 in unum coailis; scutellum magnum, postice supra abdomen productum et ejus dimidium basale superans, ad apicem furcatum; abdomen thorace paullo majus, supra planum, pedunculo (fere tertiam partem abdominis longitudine sequante) ad thoracis angulo apicale declive affixum.

OBS.—*Perilampum* (habitu) cum Eucharide (scutello armato) conjugens.

## SPECIES 1—SCHIZASPIDIA FURCIFERA. (Westw. l. c.)

PLATE XXVIII, FIG. 2.

Capite et thorace senis; facie canali profundo pro receptione antenarum, his fulvo-albidis (fig. 2 a) articulo secundo et tertio parvis fere squalibus, quarto ad decimum intus acute producto-serratis, undecimo, ut videtur, 8-annulato; mesothoracis acuto et parapsidibus semicirculariter striatis; scutello et postscutello longitudinaliter sulcatis; hoc in cornu retro producto dimidium abdominis equante, apice bifurcato; abdomine brevi cyaneo, apice fulcescente; pedibus fulvo-albidis; alis hyalinis, anticis nubila transversa pone medium brunnescente. (Fœmina?).

Long. corp. lin. 2½; expans. alar. antic. lin. 5.

Habitat; India Orientalis, Bengal. In Mus. Britann.

Varia (sexus alter?) magnitudine minori; antennis magis serratis; thorace profundius sulcato; abdomine toto fulvo.

## SPECIES 2—SCHIZASPIDIA RUDIS.

## PLATE XXVIII, FIG. 5.

*Nigra* : capite brevi lato, thoraci antice arete applicato ; antennis capite vix longioribus 12-articulatis fuscis, articulo basali fulvo, secundo tenui sed tertio longiori, hoc et reliquis brevibus distinctis sensim incrassatis et setosis (fig. 5 a) ; mesothoracis scuto grosse punctato, parapsidibus indistinctis ; scutello, basi longitudinaliter striato, postice areolato ; postscutello in cornu crasso, striato, producto, apice furcato, furcis curvatis apice obtusis, dimidium abdominis attingentibus ; abdominis pedunculo brevi cylindrico, abdomine subgloboso, nitido ; pedibus rufis ; alis cinereo-hyalinis in medio antice fusco-tinctis ; vena radiali distincta fusca, fere transverse.

Long. corp. lin. 1 $\frac{1}{2}$  ; expans. alar. antic. lin. 3.

Habitat ; South Australia (Angas). Rarissima. In Mus. Hopeiano Oxonie.

The mandibles of this species are very sickle-shaped (fig. 5 b), with two strong teeth on the inner edge, of which the second is truncated. The maxillæ (fig. 5 c) are terminated by a long narrow membranous blade, which unite and form a tubular defence for the labium. The maxillary palpi are long, slender, 4-jointed, the last joint slightly clavate. The mentum (fig. 5 d) is slender and tubular, as is the labium, the labial palpi 2-jointed, the second joint slightly clavate. The front of the thorax is vertical and concave, forming a saucer-shaped space for the reception of the head. Fig. 5 e represents the insect seen sideways, with the limbs removed.

## SPECIES 3—SCHIZASPIDIA PLAGIATA.

(Westw. MS; Walker, Trans. Ent. Soc. 3rd Ser. vol. i. p. 385.)

## PLATE XXVIII, FIG. 11.

*Nigra* : thorace grosse punctato fulvo, 8-maculato ; mesothoracis postscutello in tubercula dua brevia obtusa divergentia terminato ; metanoti lateribus in cornua dua parum arcuata apice obtusa productis ; capite transverso, supra levavi, inter oculos longitudinaliter striolato ; facie impressa et supra os transverse striolata ; antennis 12-articulatis, articulis duobus basalibus flavidis, reliquis nigris ; tertio ad undecimum ramum longum supra singulatim emittenti, duodecimo longitudine rami precedentis ; pedunculo brevi ; abdomine ovali subcompresso, nigro-seneo nitido ; alis pallide flavo-fuscescentibus ; pedibus flavido-albidis ; tarsorum articulo apicali fuso.

Long. corp. lin. 2 $\frac{1}{2}$  ; expans. alar. antic. lin. 5.

Habitat ; Para. In Mus. Britann.

## SPECIES 4—SCHIZASPIDIA CAFFRA.

## PLATE XXVIII, FIG. 12.

Capite nigro, subnovo ; facie impressa et supra semicirculariter striolata ; antennis nigris 12-articulatis, articulo primo satis longo, secundo parvo, tertio obconico, quarto ad undecimum singulatim ramum longum setosum emitente, duodecimo longitudine rami precedentis ; thorace anno valde convexo ; mesocuto parapsidibus indeterminatis, transverse striolato ; scutello indistincto, postscutello convexo, longitudinaliter striato, spinis duabus rectis armato ; pedunculo modicori ; abdomine parvo compresso, chalybeo, nitidissimo ; pedibus piceis femoribus nigris ; alis hyalinis, vena radiali minuta pallide fusa.

Long. corp. lin. 2 ; expans. alar. antic. lin. 4.

Habitat ; Caffraria. In Mus. Hopeiano Oxonie, & Mus. Reg. Holm. communicata.

The obliteration of the parapsides and scutellum, and the simple third joint of the antennæ, together with the peculiar armature of the postscutellum, distinguish this insect from all the other species of the sub-family.

## SPECIES 5—SCHIZASPIDIA (?) MACULATA.

## PLATE XXVIII, FIG. 1.

Capite nigro-aeneo, punctato; antennis gracilibus simplicibus obscure fulvis, articulo secundo brevi, tertio longiori, 4-8 parvis subequalibus; thorace luteo-fulvo, punctato, dorso mesonoti nigro maculato; postscutello semicirculare, macula ovali media nigra, apice in spinas duas parvas producto; metathorace fere verticale; abdomine obscure luteo, dorso nigro nitido, brevi, lato, pedunculo mediocri deflexo; alis hyalinis; venis fuscis; pedibus pallide luteis. (Fœmina?).

Long. corp. lin. 2; expans. alar. antic. lin. 5.

Habitat; Brasilia. 'Du midi de la Capitainerie de Goyaz.' In Mus. Jardir des Plantes, Paris.

## GENUS—THORACANTHA.

## SPECIES 1—THORACANTHA APTA.

(Walker, Trans. Ent. Soc. Lond. 3rd Ser. i. p. 384.)

## PLATE XXVIII, FIG. 3.

Atra, crassa, abbreviata: capite brevi transverso; antennis (maris) nigris basi luteis, capitatis latitudine haud longioribus, articulo primo crasso, secundo minuto, tertio ad undecimum brevissimis, singulo rami longum pubescentem emittente, duodecimo (ultimo) longitudine rami articuli precedentis; thorace gibbo; mesonoti scuto cum parapsidibus semicirculariter striolatis; scutello longitudinaliter striato, serieque transversa punctorum distineto; postscutello in spinas duas laterales acutissimas ad apicem abdominis extensis (spatio intermedio emarginato); pedibus pallide fulvis; alis limpidis venis pallidis, radiali fere oblitterata; abdominis petiolo crassiusculo, abdomine parvo compresso.

Long. corp. lin. 1 $\frac{1}{2}$ ; expans. alar. antic. lin. 3 $\frac{1}{2}$ .

Habitat; Amazonia, Santarem et Villa Nova (Bates). In Mus. Britan. et Hopeiano Oxonie.

## SPECIES 2—THORACANTHA FLAVICORNIS.

(Walker, Trans. Ent. Soc. Lond. 3rd Ser. vol. i. p. 382.)

## PLATE XXVIII, FIG. 4.

Nigra: thorace luteo-villoso; capite brevi, antennis fulvis, apicem versus paullo crassioribus, articulis 10, articulo primo longo, secundo brevi, tertio longiore ad basin angustato, quarto ad nonum fere equalibus, decimo ovali exarticulato (fig. 4 a); mesonoti scuto transverso striato; scutello bilobato sulco medio longitudinali, postscutello in lobos duos latissimos, fere longitudine abdominis, apice rotundatis; in singulo costa elevata submarginali; pedunculo robusto striato longiusculo; abdomine valde compresso, thorace paullo longiori; pedibus pallide flavis; alis limpidis.

Long. corp. lin. 2; expans. alar. antic. lin. 4.

Habitat; Amazonia, Villa Nova (Bates). In Mus. Britan.

It is necessary to observe that the figure of this species is taken from the typical specimens in the British Museum described by Mr. Walker, who has omitted to allude to the luteous villose clothing of the thorax,—a character occurring in no other species of the great family to which it belongs. Fig. 4 b represents the side view of the insect with the limbs cut off.

## SPECIES 3—THORACANTHA ACULEATA. (Mas.)

## PLATE XXVIII, FIG. 9.

Nigro-cerulea, nitida: capite brevi transverso punctato; antennis nigris, brevibus 12-articulatis, articulis duobus basalibus fulvis, articulis tertio ad undecimum in mare ramum longum emittente, duodecimo longitudine rami praecedentis; foeminae simplicibus articulo primo brevi, secundo brevissimo; reliquis 10 fere aequalibus (fig. 9a); mesothoracis scuto semicirculariter striato dorso rugoso; postscutello valde elongato, abdomen longe superanti, nitidissimo, in spinas duas acutissimas, longitudinaliter carinatas producto; pedunculo mediocri; abdomine compresso; alis limpidis, venis fere inconspicuis; spinis mesonoti brevioribus; pedibus fulvis.

Long. corp. ad apicem spinarum thoracis lin. 2 $\frac{1}{2}$ .

Habitat: Brasilia, in Mus. Swainson olim; Amazonia (Bates), in Mus. Hopeiano Oxonie; 'Du midi de la Capitainerie de Goyaz,' in Mus. Jardin des Plantes, Paris.

Syn.: (Mas.) *Thoracantha flabellata*. Westw. in Proc. Zool. Soc. Lond. April 14, 1835, No. 28, p. 52 (nec *Euch. flabellata* Fab.).

(Fem.) *Thoracantha aculeata* Westw. MS. in Coll. Jardin des Plantes, Paris; Blanchard in Cuvier Règne An. Ed. Crochard. Ina. pl. CXIII, fig. 8.

## SPECIES 4—THORACANTHA CORONATA.

## PLATE XXVIII, FIG. 10.

Aeneo-nigra: capitis vertice in cornua dua obtusa elevata; oculis conoideis lateribus porrectis (fig. 10a); antennis brevibus, luteo-fuscis, 12-articulatis, articulo secundo minuto, tribus ultimis in massam ovalem vix articulo praecedente majorem, coalitis (fig. 10b); mandibulis valde falcatis, palpis gracillimis; mesothoracis scuto valde gibboso, parapsidibus valde distinctis semicirculariter striatis; scutello longitudinaliter striato; serieque transversa punctorum notato; postscutello longitudinaliter striatello angulisque posticis in cornua dua longa arcuata apice acuta, abdomine paullo longiora, productis; pedunculo abdomine dimidio breviori; hoc ovali compresso nigro; pedibus gracillimis, flavo-albidis, coxis nigris; alis hyalinis stigmate parvo obscuro.

Long. corp. lin. 2 $\frac{1}{2}$ ; expans. alar. antic. lin. 4 $\frac{1}{2}$ .

Habitat: America Meridionali, Bahia et Amazonia. In Mus. Hopeiano Oxonie.

## SPECIES 5—THORACANTHA BATESELLA.

## PLATE XXVIII, FIG. 8.

Purpureo-cyanea, opaca, punctata: capite transverso tenne punctato; antennis gracilibus, in utroque sexu 11-articulatis; in mare articulo primo longo fulvescenti, secundo minuto, reliquis fuscis, tertio elongato ramum longum ad apicem emittenti, quarto ad decimum similiter ramosis, undecimo longitudine rami praecedentibus (fig. 8a); in foemina filiformibus, articulo tertio longissimo, reliquis 8 brevibus clavam tenuem formantibus (fig. 8b); thorace ovali, metathoracis scuto subquadrato, in medio sulcato; scutello sulcato serieque transversa punctorum notato, postscutello in utroque sexu in spinas duas magnas crassas subarcuatas, granulosas, apice acutas, et ad apicem abdominalis attingentes, sordide luteas, basi purpureas, emittente; pedunculo longo tenui cyaneo cylindrico; abdomine ovali compresso nigro; pedibus luteo-albidis; alis hyalinis, radio parvo fusco.

Long. corp. lin. 3; expans. alar. antic. lin. 5.

Habitat: Amazonia (Bates). In Mus. Hopeiano Oxonie.

## GENUS—EUCHARIS.

## EUCHARIS DEPRIVATA.

(Walker, Annals Nat. Hist. 3rd Ser. vi. p. 359.)

## PLATE XXVIII, FIG. 6.

Mas. Viridis cupreo varia, rude punctata: facie longitudinaliter striata; antennis longis luteo-fuscis basi pallidis, gracilibus 12-articulatis, articulo secundo minuto, tertio ad undecimum ramum longum gracilem singulatim emittente; duodecimo longitudine rami precedentis articuli; thorace gibbo; mesomoto postice in tuberculum conicum parum prominens elevato; pedunculo longo cylindrico viridi; abdomine fusiformi compresso castaneo subtus pallidiori; pedibus pallide flavis longis gracilibus; alis cinereo-hyalinis nubila substigmaticallyl brunnea.

Fœmina major: antennis longis gracilibus fuscis articulo basali fulvescenti, secundo minuto, reliquis 10 simplicibus sensim brevioribus (fig. 6 a); coloribus obscurioribus, pedunculo abdominalis breviori, abdomine piceo.

Long. corp. maris lin. 2; expans. alar. antic. lin. 4 $\frac{1}{2}$ .

Habitat; Ceylon; valde communis (D. Thwaites). In Mus. Hopeiano Oxonie.

## GENUS—STILBULA. (Spinola.)

## STILBULA PEDUNCULARIS.

## PLATE XXVIII, FIG. 7.

Obscure cuprea viridi parum diversa, punctata: capite brevi transverso; facie in medio excavata pro receptione antennarum; antennis longis gracilibus, in utroque sexu simplicibus 12-articulatis, articulo primo parum elongato, secundo brevissimo, tertio longo, reliquis in mare filiformibus, in femina sensim abbreviatis, ultimis submoniliformibus (fig. 7 a); thorace gibboso ovato; mesothoracis scuto in medio sulco longitudinali, parapsidibus magnis; postscutello trigono, in cornu tenui breve apice furcato producto, furcis obtusis; pedunculo longo, tenui albido, pone medium nigro annulato; abdomine pedunculo parum breviori subelavato compresso nigro nitido; pedibus lutescentibus, femoribus in medio obscurioribus; alis hyalinis iridescentibus, radio in maculam trigonam dilatato.

Fœmina major, obscurior, pedunculo breviori.

Long. corp. lin. 2 $\frac{1}{2}$ ; expans. alar. antic. lin. 3 $\frac{1}{2}$ .

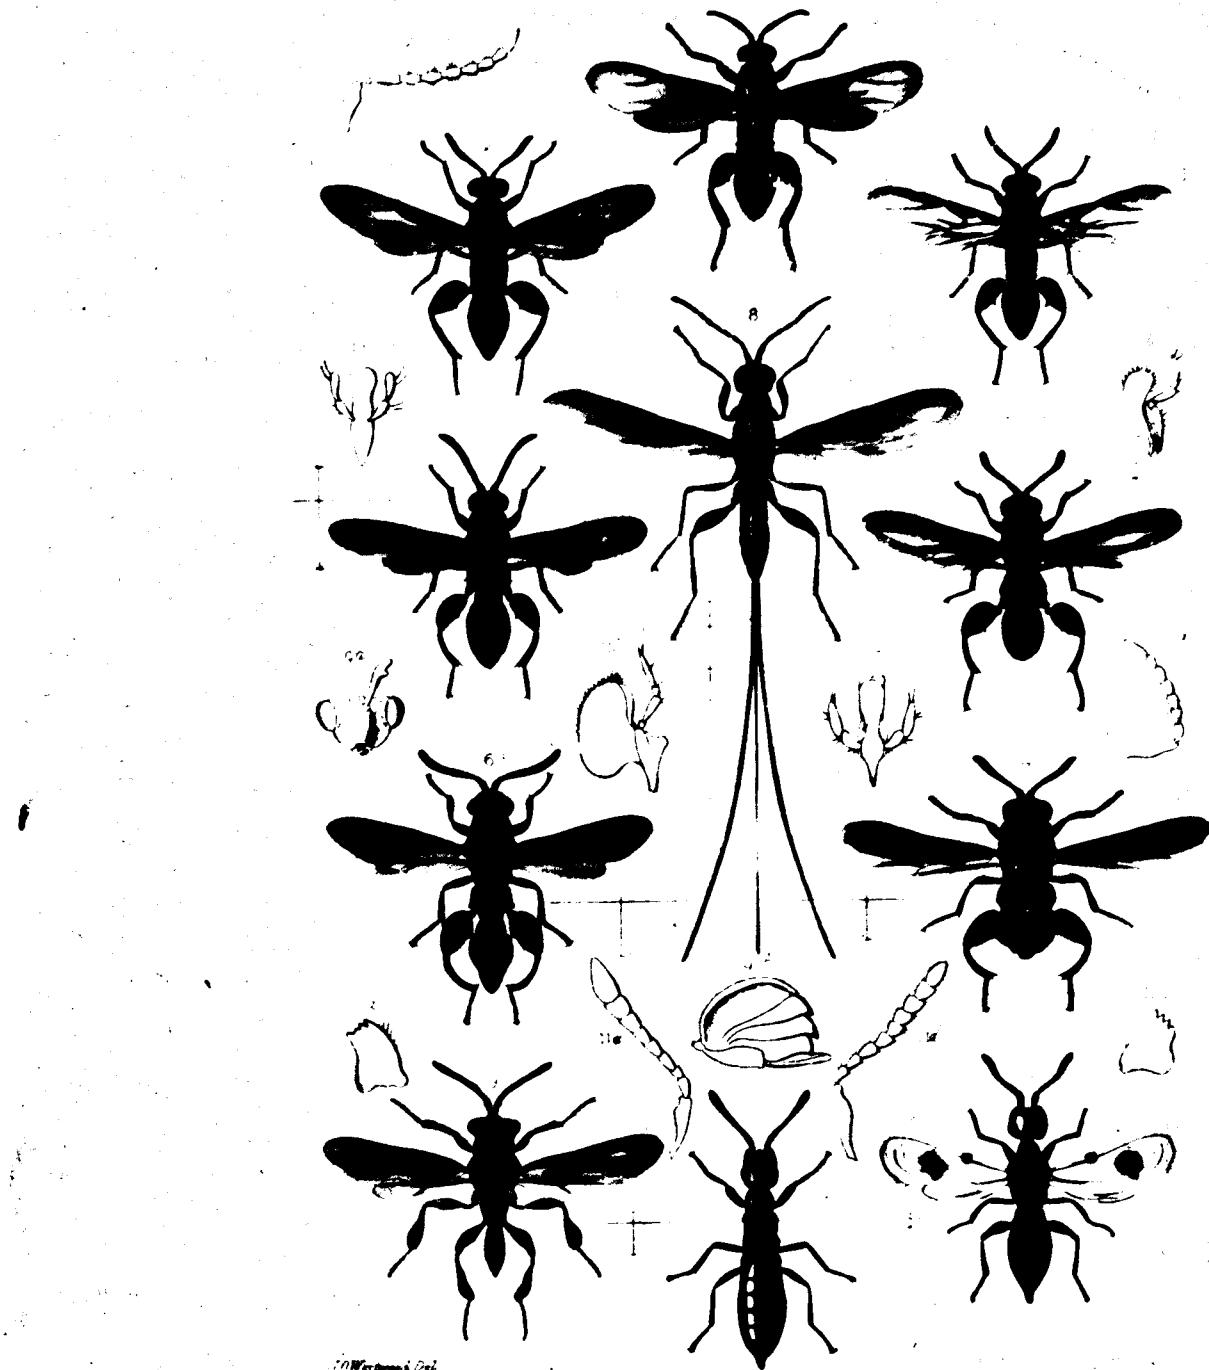

Habitat; South Australia (Angas). In Mus. Hopeiano Oxonie.
